

X-SLED

High Volume Bow and Rocker

With a raised bow height the X-Sled is able to handle tethers in swift water whilst reducing the risk of the bow diving when loaded. The increased volume maintains stability when occupied by a casualty or rescuer.

Inflation and overpressure valves

Leaffield valves are used and are widely recognised as world leaders in valve manufacturing. Our valves all work with our boat inflation kit and pump.

Low profile grab handles

Fitted with 15 low profile grab handles, aiding team carries and in-water casualty management.

15 cm Airdeck hull

The new 15 cm PVC Fusion Dropstitch offers high floatation, dry deck and a rigid platform.

3 Chambers

The sled is built with 3 separate inflatable chambers, providing added security should one of the chambers become compromised.

3 Person craft

The X-Sled has been designed to carry 2 rescuers and 1 casualty. Although the sled will float up to 5 people successfully, this does affect its use in turbulent water.
